

## • Background

We encountered issues

1, ADSP(Audio) did not sleep, resulting in high power consumption on SDM660/SDM630

From ADSP dump, we can see here latency vote of 1ms from TOUCH is blocking ADSP to enter in to XO

[--- Latency Voters ---]

clientId = 3

clientName = DCVSCIt\_TARGET

latency (us) = 65535

clientId = 30

clientName = adsprpc\_08\_0

latency (us) = 1000

0624200 F03903C0 0000008A 46 8 WAITING IRQ\_TOUCH

2, ADSP crash on MSM8953/8917, error type :

Error from ADSP:

Error cause: ERR\_PRECISE, a precise exception occurred.

From the kernel log, we can see "hbtpr" is running

```
148986.882970: <2> init: Starting service 'hbtpr'...
```

```
148987.059166: <2> init: Service 'hbtpr' (pid 10980) exited with status 255
```

```
148987.059232: <2> init: Service 'hbtpr' (pid 10980) killing any children in process group
```

```
148991.172139: <2> init: Starting service 'hbtpr'...
```

This may be due to improveTouch(hbtpr) is running.

improveTouch(hbtpr) is ADSP based touch panel feature, if you don't use it please disable it.

## • How to disable improveTouch(hbtpr) of QC

As a quick fix recommendation they can go to the `init.qcom.post_boot.sh` script used by them in Android user-space and do the changes as shown.

`device/qcom/common/rootdir/etc/init.qcom.post_boot.sh`

```
- # Start Host based Touch processing

- case "$hw_platform" in

- "MTP" | "Surf" | "RCM" )

- #if this directory is present, it means that a

- #l200p panel is connected to the device.

- dir="/sys/bus/i2c/devices/3-0038"

- if [ ! -d "$dir" ]; then

- start hbtcp

- fi

- ;;

- esac
```

For a much clean and optimized solution, they can remove the below code snippets

### **LA Kernel Configuration**

For internal solution, we use these configs:

- `arch/arm/configs/msmcortex-perf_defconfig`
- `arch/arm/configs/msmcortex_defconfig`
- `arch/arm64/configs/msmcortex-perf_defconfig`
- `arch/arm64/configs/msmcortex_defconfig`

```
- CONFIG_INPUT_HBTP_INPUT=y
```

### **LA DT node**

For internal solution, we use these DT files:

- `arch/arm/boot/dts/qcom/msm8953-mtp.dtsi`
- `arch/arm/boot/dts/qcom/msm8953-cdp.dtsi`

```

- hbtcp {

- compatible = "qcom,hbtp-input";

- vcc_ana-supply = <&pm8953_l10>;

- vcc_dig-supply = <&pm8953_l15>;

- qcom,afe-load = <50000>;

- qcom,afe-vtg-min = <2850000>;

- qcom,afe-vtg-max = <2850000>;

- qcom,dig-load = <15000>;

- qcom,dig-vtg-min = <1800000>;

- qcom,dig-vtg-max = <1800000>;

- };

```

### **Android User-space post-boot script**

For internal solution, we use : device/qcom/common/rootdir/etc/init.qcom.post\_boot.sh

```

- # Start Host based Touch processing

- case "$hw_platform" in

- "MTP" | "Surf" | "RCM" )

- #if this directory is present, it means that a

- #1200p panel is connected to the device.

- dir="/sys/bus/i2c/devices/3-0038"

- if [ ! -d "$dir" ]; then

- start hbtp

- fi

- ;;

- esac

```

## Android User-space init.target.rc

For internal solution, we use

device/qcom/msm8953\_32/init.target.rc (32 bit)

device/qcom/msm8953\_64/init.target.rc (64 bit)

- mkdir /data/misc/hbtp 0750 system system

#start camera server as daemon

service qcmerasvr /system/bin/mm-qcamera-daemon

@@ -248,12 +247,6 @@ on property:sys.ims.DATA\_DAEMON\_STATUS=1

start ims\_rtp\_daemon

start imscmservice

-service hbtp /system/vendor/bin/hbtp\_daemon

- disabled

-

Also if the device id's are being returned for MTP, then In TZ, following changes need to be done (highlighted in yellow) in the `core\buses\qup_accesscontrol\bear\config\QUPAC_8953_Access.xml` for `<device id=BLSP_QUP_3_DEV_ACCESS>` (assuming that the customer still uses QUP3 for connecting the Touch screen).
