## 1. Description

The LTR-578ALS-039 is an integrated low voltage I2C ambient light sensor (ALS), and proximity sensor (PS), with built-in emitter in a single miniature chip lead-free surface mount package.

The ALS provides a linear response over a wide dynamic range, which is well suited to applications under very low or bright ambient brightness. Besides, with built-in proximity sensor, this sensor offers the feature to detect object at a user configurable distance.

The sensor has a programmable interrupt with hysteresis to response to events and that removes the need to poll the sensor for a reading which improves system efficiency. This CMOS design and factory-set one time trimming capability ensure minimal sensor-to-sensor variations for ease of manufacturability to the end customers.

## 2. Features

- I<sup>2</sup>C interface (Standard mode @100kHz or Fast mode @400kHz)
- Ambient Light and Proximity Sensing in one ultra-small ChipLED package
- Very low power consumption with sleep mode capability
- Operating voltage ranges: 1.7V to 3.6V
- Operating temperature ranges: -40 to +85 °C
- Built-in temperature compensation circuit
- Programmable interrupt function for ALS and PS with upper and lower thresholds
- RoHS and Halogen free compliant

### ALS Features

- 16 to 20 bits effective resolution
- Wide dynamic range with linear response
- Close to human eye spectral response
- Automatic rejection for 50Hz/60Hz lighting flicker

### PS Features

- Built-in LED driver and detector
- High ambient light suppression
- 8, 9, 10, 11-bit(selectable) effective resolution
- Cancellation of crosstalk
- Programmable LED drive settings

### 3. Applications

- Control brightness of display panel
- Object detection in mobile, computing, and consumer devices.

### 6. Functional Block Diagram

LTR-578ALS-039 contains 2 photodiodes (Visible and IR diode) for respective photocurrent measurement. The photodiode currents are converted to digital values by ADCs. The sensor also included an emitter LED, as well as some peripheral circuits such as an internal oscillator, a current source, voltage reference, and internal fuses to store trimming information.

## 8. Ratings and Specifications

### Absolute Maximum Ratings at Ta = 25°C

Parameter	Symbol	Min.	Max	Unit
Supply Voltage	VDD		4.0	V
Digital Voltage Range	SCL, SDA, INT	-0.5	4.0	V
Max Voltage Range	LDR	-0.5	4.0	V
Storage Temperature	T <sub>stg</sub>	-40	100	°C
Electrostatic Discharge Protection (Human Body Model JESD22-A114)	V <sub>HBM</sub>		2000	V

Note: Exceeding these ratings could cause damage to the sensor. All voltages are with respect to ground. Currents are positive into, negative out of the specified terminal.

### Recommended Operating Conditions

Description	Symbol	Min.	Typ.	Max.	Unit
Supply Voltage	VDD	1.7		3.6	V
LED Supply Voltage	V <sub>LED</sub>	2.3		4.5	V

Revision ID	3:0	0001	Revision ID

### MAIN\_STATUS Register (0x07) (Read Only)

This register stores the information about the ALS and PS interrupts and data status. The interrupt status in Bit 4 and Bit 1 determines if the ALS and PS interrupt criteria are met in Normal Interrupt Mode. It triggers when the ALS and/or PS data is above the upper or below the lower threshold for a specified number of consecutive measurements in respective interrupt persist settings. This register also provides PS logic signal status, which is used for indicating whether the detected object is near (PS data larger than PS upper threshold settings) or far (PS data smaller than PS lower threshold settings). For details interrupt behavior, refer to Section 10.

			1	PS data is new data (Data has not been read and will be cleared after read)

### PS\_DATA Register (0x08 / 0x09) (Read Only)

The PS ADC channel data are expressed as an 11-bit data spread over 2 registers. The PS\_DATA\_0 and PS\_DATA\_1 registers provide the lower and upper byte respectively. An overflow bit is available to check if the PS data overflows.

When I2C read operation is active and points to any of the register address between 0x07 and 0x18, both registers PS\_DATA\_0 and PS\_DATA\_1 will be locked until the I2C read operation has been completed or the specified address range is left. New measurement data is stored into temporary registers and the PS\_DATA registers will be updated as soon as there is no on-going I2C read operation to the address range 0x07 to 0x18.

### ALS\_DATA Register (0x0D / 0x0E / 0x0F) (Read Only)

The ALS Channel digital output data are expressed as a 16 to 20 bit unsigned integer data. When I2C read operation is active and points to any of the register address between 0x07 and 0x18, all 3 registers will be locked until the I2C read operation has been completed or the specified address range is left. This is to ensure that the data in the registers is from the same measurement even if an additional measurement cycle ends during the read operation. New measurement data is stored into temporary registers and the ALS\_DATA registers will be updated as soon as there is no on-going I2C read operation to the address range 0x07 to 0x18.

### INT\_CFG Register (0x19) (Read/Write)

This register controls the operation of the interrupt pin and functions. ALS and PS have independent interrupt signal and both ALS and PS interrupts are active low. PS interrupt is enabled by Bit 0, and it is threshold triggered based. Besides, ALS interrupt is enabled by Bit 2, and its output pin can be selected as either Normal Interrupt Mode or PS Logic Output Mode through Bit 1. Under Normal Interrupt Mode, the edge-triggered interrupt signal output will be maintains at active level until MAIN\_STATUS register is read. While for PS Logic Output Mode, the interrupt pin output is updated after every measurement and output state is maintained between measurements.

### PS\_CAN Register (0x1F / 0x20) (Read/Write)

This register defines the offset compensation value for proximity offsets caused by device variations, optical crosstalk and other environment factors. This register sets the PS cancellation value to be subtracted from the measured PS data before the data is transferred to the PS\_DATA registers.

### 10. Application Information

#### 10.1 Lux Formula

Lux\_Calc is the calculated lux reading and ALS DATA is the digital representation (output ADC) of ambient light level stored in the registers (Address: 0x0D-0x0F) regardless of light sources.

**For no window (Clear window)**

$$Lux_{Calc} = \frac{0.8 \times ALS_{DATA}}{(GAIN \times INT)}$$

**For device under window (eg: Tinted window)**

Window Factor is needed when device under Window glass with coated tinted ink. This is to compensate the light loss due to the lower transmission rate of the window glass.

$$Lux_{Calc} = \frac{0.8 \times ALS_{DATA}}{(GAIN \times INT)} \times Window Factor$$

Where:

ALS Gain	GAIN
X1	1
X3	3
X6	6
X9	9
X18	18

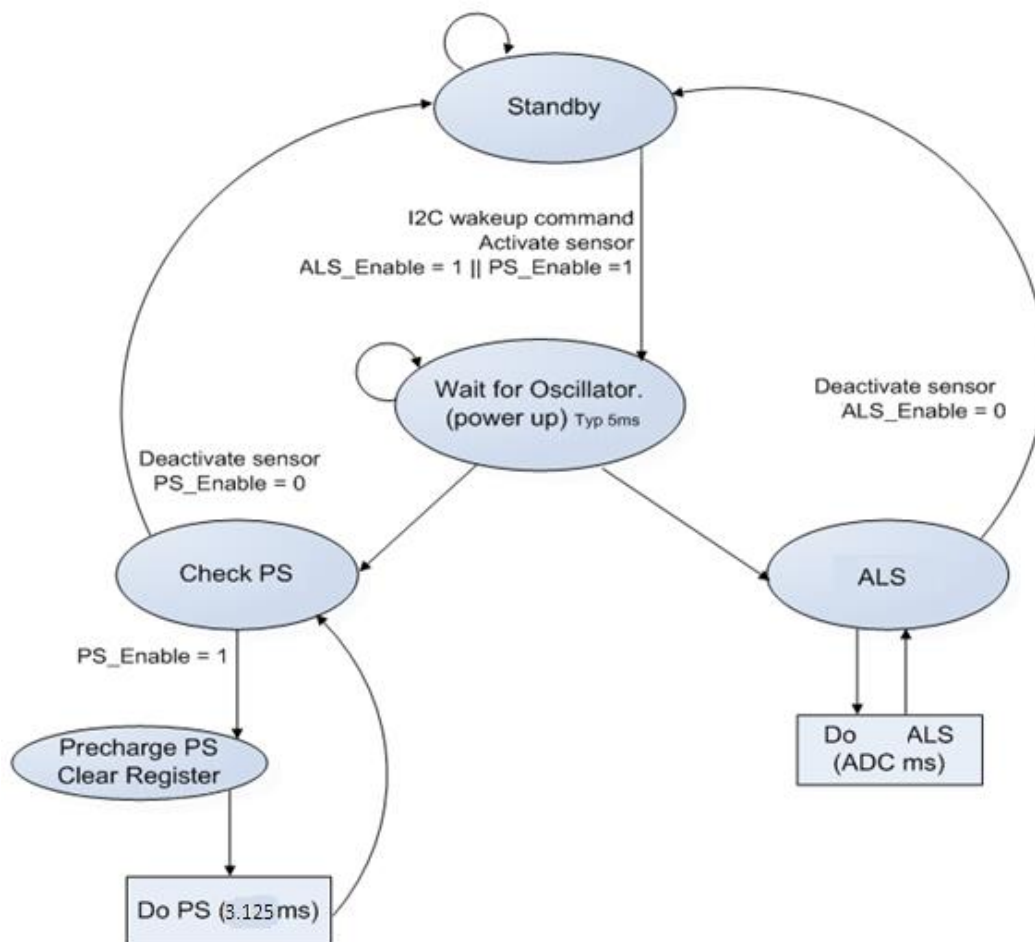

Resolution (bit) / Integration Time (ms)	INT
16-bit, 25ms	0.25
17-bit, 50ms	0.5
18-bit, 100ms	1
19-bit, 200ms	2
20-bit, 400ms	4

### 10.2 Device Operation (State Machine and Interrupt Features)

#### State Machine

Below diagram is the main state machine of LTR-578ALS.

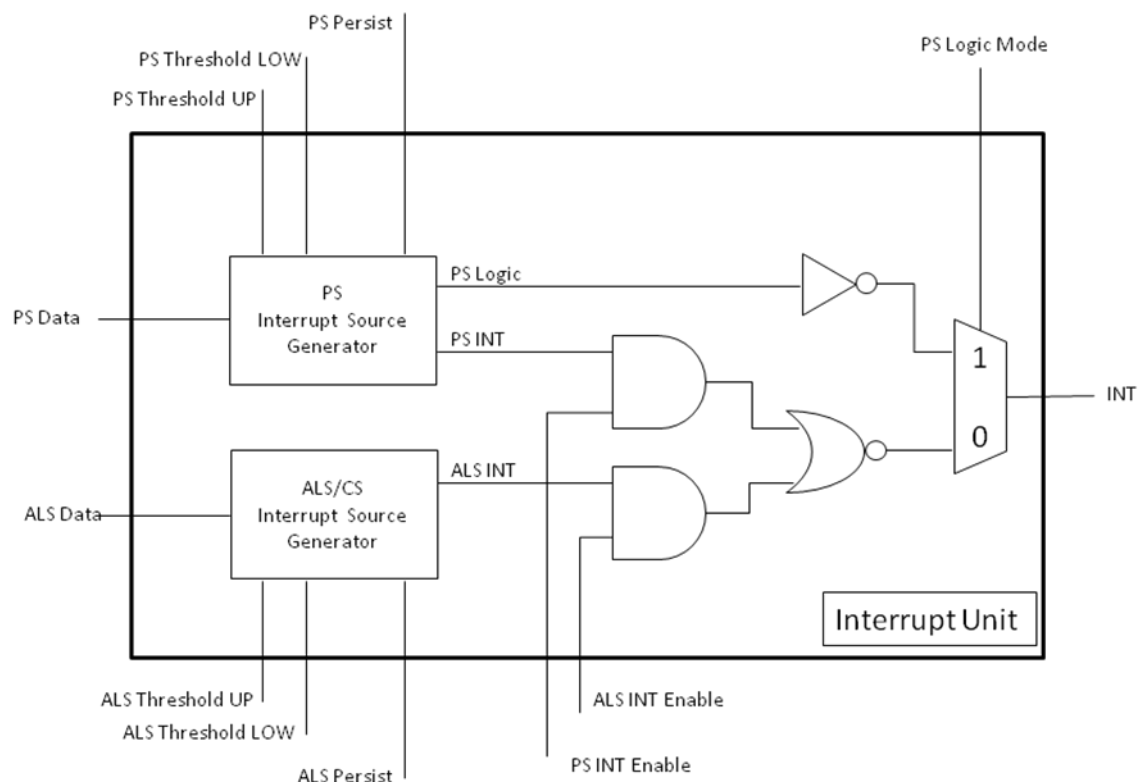

During the ALS and PS Operation, ALS measurements can be activated by setting the **ALS\_Enable** bit to 1, and PS measurement can be activated by setting the **PS\_Enable** bit to 1. As soon as the PS and/or the ALS sensors become activated through an I2C command, the internal support blocks are powered on. Once the voltages and currents are settled (typically after 5ms), the state machine checks for trigger events from a measurement scheduler to start ALS or PS conversions according to the selected measurement repeat rates. Once **PS\_Enable** or **ALS\_Enable** is changed back to 0, a running conversion on the respective channel will be completed and the relevant ADCs and support blocks will move to power-down state.

## Optical Sensor LTR-578ALS-039

### Interrupt Features

This device generates independent ALS and PS interrupt signals that can be multiplexed and output to the INT output pin. The interrupt conditions are always evaluated after completion of a new conversion of the ALS and PS channels. The PS Logic Mode has priority over any other interrupt signal. If selected (PS Logic Mode = 1), no ALS interrupt can be signaled at the INT pad. ALS and PS interrupts as well as PS Logic Mode are active low at the INT pin.

### ALS Interrupt

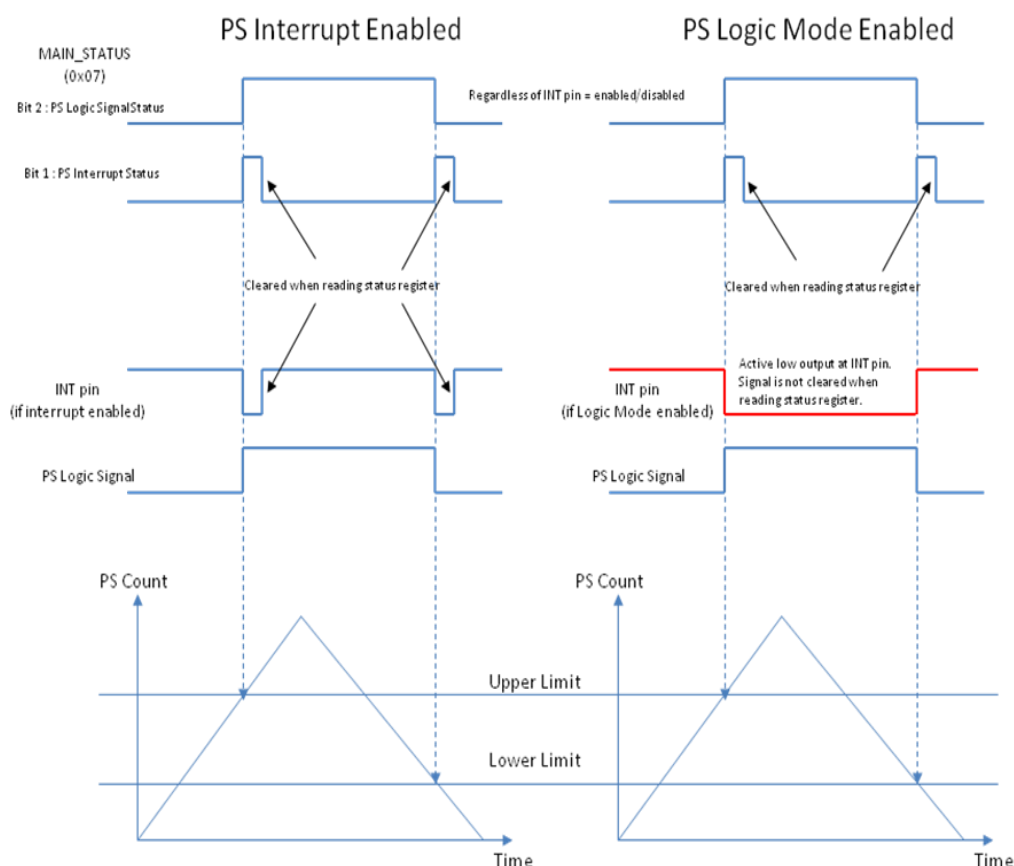

The ALS interrupt is enabled by Bit 2 (ALS INT Pin Enabled) of INT\_CFG register (0x19). The ALS interrupt source is ALS channel. The INT is set when the data of the selected interrupt source is above the upper or below the lower threshold for a specified number of consecutive measurements set in ALS Persist in INT\_PST register (0x1A). The Interrupt signal is also stored in MAIN\_STATUS register (0x07) as flag bit in Bit 4 (ALS INT Status). This status flag bit is cleared by reading the MAIN\_STATUS register. A cleared flag will also clear the interrupt signal on the INT pin.

## Optical Sensor LTR-578ALS-039

### PS Interrupt

The PS interrupt is enabled by Bit 0 (PS Interrupt Pin Enable). It triggers when the PS conversion result is above the upper or below PS threshold for a specified number of consecutive measurements set in PS Persist in INT\_PST register (0x1A). The PS Logic Signal, Bit 2 of MAIN\_STATUS register (0x07), is set to 0 when the PS data is below the lower PS threshold and it set to 1 if the PS data is above the upper PS threshold.

There are two options to indicate a PS interrupt signal on the INT pin: as a continuous logic signal or as an edge-triggered interrupt signal, which is cleared with the next read-out of the MAIN-STATUS register. The PS interrupt signal is also stored in MAIN\_STATUS register (0x07) as flag bit in Bit 1 (PS INT Status). This status flag bit is cleared by reading the MAIN\_STATUS register. The PS interrupt behavior is as shown below.

**Optical Sensor  
LTR-578ALS-039****13. Moisture Proof Packaging**

All LTR-578ALS-039 are shipped in moisture proof package. Once opened, moisture absorption begins. This part is compliant to JEDEC J-STD-033A Level 3.

**Time from Unsealing to Soldering**

After removal from the moisture barrier bag, the parts should be stored at the recommended storage conditions and soldered within seven days. When the moisture barrier bag is opened and the parts are exposed to the recommended storage conditions for more than seven days, the parts must be baked before reflow to prevent damage to the parts.

**Recommended Storage Conditions**

<b>Storage Temperature</b>	10°C to 30°C
<b>Relative Humidity</b>	Below 60% RH

**Baking Conditions**

<b>Package</b>	<b>Temperature</b>	<b>Time</b>
In Reels	60°C	48 hours
In Bulk	100°C	4 hours

Baking should only be done once.

## 14. Recommended Land Pattern and Metal Stencil Aperture

### Recommended Land Pattern for LTR-578ALS-039

Note: All dimensions are in millimeters

## Optical Sensor LTR-578ALS-039

### Recommended Metal Stencil Aperture

It is recommended that the metal stencil used for solder paste printing has a thickness (t) of 0.11mm (0.004 inches / 4 mils) or 0.127mm (0.005 inches / 5 mils).

The stencil aperture opening for LTR-578ALS-039 pads is recommended to be 0.80mm x 0.80mm which has the same dimension as the land patterns. For the center pad stencil aperture opening will be 4.54 mm x 0.62 mm. This is to ensure adequate printed solder paste volume and yet no shorting.

### 15. Package Dimension for Tape and Reel

#### Notes:

1. All dimensions are in millimeters
2. Empty component pockets sealed with top cover tape
3. 13 inch reel – 1500 pieces per reel
4. In accordance with ANSI/EIA 481-1-A-1994 specifications
